STAKEHOLDERS AND INITIAL BRIEF

The aim is to create a virtual system which can be accessed remotely by different farmers and can provide an accessible interface to log livestock data such as movements, age, heritage, enclosure etc so that farmers can coordinate dates and their livestock more easily to avoid clashes.

The stakeholders of this project are the livestock manager and livestock assistants at the following farms:

- Windmill Hill City Farm
- Hartcliffe City Farm
- St Werburghs City Farm

USER STORY

- The livestock manager of three city farms would like a system that automates the input of specific dates and relevant animal data into a calendar, so that they can spend time managing other areas of their work. They would like to move their newly bred pigs to windmill hill city farm, but they are not sure whether there is enough space within their pens, and this is urgent so they can't wait for a response due to having too many pigs within their own current pens. So, they need a way to quickly check if there is capacity at their chosen farm and if not where else could they put this pig. Our project solves this scenario by providing an interface for viewing capacities for different farms and enclosures, allowing the livestock manager to check capacities quickly before moving an animal.

DEMO

ISSUES WE FACED

- Not using the Kanban board to sync work up efficiently meaning people were doing the same work simultaneously
- React
- Having to potentially redo the backend

CLIENT FEEDBACK

- Different colors for identifying different farms for events
- Shared calendar
- Attaching animals to events
- Different tabs for different farms
- Checkboxes with events to signify completeness

TB2 PLAN

- We are going to create implementation for allowing the user to create new animals and associated events and attributes themselves as it allows for more flexibility than our current system which only has a few specific and set types
- Improve the frontend and make it look better and more easily accessible so that the user can more easily access and modify events and animals
